CEMENTING SYSTEMS

Oilfield hydraulic cement plays an important role in the well construction process, but only if the cement is properly designed for placement and is capable of withstanding critical draw-down pressures and temperature changes. With harsher environments and increased concern on environmental sustainability, customers must place even more focus on improving sheath integrity. At Independence , we realize that cementing is one of the most critical steps in the construction process, but often times is overlooked in a rush to production.

Independence Oilfield Chemicals now offers a wide selection of cementing chemicals and additives that help to achieve optimum cement sheath integrity and support the casing for good zonal isolation. In addition, we work closely with our customers to co-develop systems that work to achieve better well construction and long-term zonal isolation with a focus on minimizing formation damage.

Product Offerings

Anti-Foamer & DeFoamers
Dispersants
Fluid Loss Agents
Foam Agents

Gas Control Additives
Lost Circulation
Mud Flush/Spacer
Retarders/Accelerators

Bonding Agents
Expansion Additives
Weighting and Density Control Agents
Specialty Cements
