

## PRODUCTS

By taking the production view approach, Independence Oilfield Chemicals optimizes your fluid design to treat production-related issues during stimulation.

Rather than compartmentalizing chemical programs, our focus is to start each field by planning for future production and securing flow assurance. We also understand that certain wells are more problematic and should be addressed separately for the purpose of reducing costs across the entire field, helping you do more with less while continuing to enhance your results.

Independence Oilfield Chemicals prides itself on co-developing proprietary stimulation systems integrated with production chemicals to solve complex reservoir problems, lessen formation damage, and reduce unnecessary expense. In addition, we're adept at replacing chemicals with optimized systems and finding ways for our customers to improve their economics.

### Green Oilfield Chemicals

In addition, Independence Oilfield Chemicals appreciates the concerns that regulators and the community have regarding the use of oilfield chemicals. We strongly believe in using chemical products that are effective, but carry minimal environmental risk and cause minimal impact on the environment and people.

Our nature friendly green products are developed to reduce environmental hazards and drastically decrease your operational risk associated with stimulation and production chemicals. Some of our product components are used in the food industry and have already been approved for use in some of the most environmentally sensitive areas of the world.

More than just an oilfield chemical supplier, we think of ourselves as solutions providers. We partner with our customers to assure that they get the best return for investment for their wells.
